## Math 3013 Solutions to Problem Set 2

- 1. Reduce the following matrices to row-echelon form, and reduced row-echelon form.
- (a)

$$\left[\begin{array}{rrrrr} 2 & 1 & 4 \\ 1 & 3 & 2 \\ 3 & -1 & 6 \end{array}\right]$$

• Multiplying the first row by, respectively,  $-\frac{1}{2}$  and  $-\frac{3}{2}$  and, respectively, adding the results to the second and third rows produces

$$\begin{array}{ccc} R_2 \to R_2 - \frac{1}{2}R_1 \\ R_3 \to R_3 - \frac{3}{2}R_1 \end{array} \Rightarrow \begin{bmatrix} 2 & 1 & 4 \\ 0 & \frac{5}{2} & 0 \\ 0 & -\frac{5}{2} & 0 \end{bmatrix}$$

Adding the second row to the third now yields

$$R_3 \to R_3 + R_2 \quad \Rightarrow \quad \left[ \begin{array}{ccc} 2 & 1 & 4 \\ 0 & \frac{5}{2} & 0 \\ 0 & 0 & 0 \end{array} \right]$$

This last matrix is in **row-echelon form**.

Multiplying the first row by  $\frac{1}{2}$  and the second row by  $\frac{2}{5}$  produces

$$\begin{array}{ccc} R_1 \to \frac{1}{2}R_1 \\ R_2 \to \frac{2}{3}R_2 \\ \end{array} \Rightarrow \begin{bmatrix} 1 & \frac{1}{2} & 2 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \\ \end{bmatrix}$$

Adding  $-\frac{1}{2}$  times the second row to the first row produces

$$R_1 \to R_1 - \frac{1}{2}R_2 \quad \Rightarrow \quad \begin{bmatrix} 1 & 0 & 2 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

This last matrix is in reduced row-echelon form.

(b)

$$\left[\begin{array}{rrrrr} 0 & 2 & -1 & 3 \\ -1 & 1 & 2 & 0 \\ 1 & 1 & -3 & 3 \\ 1 & 5 & 5 & 9 \end{array}\right]$$

• Interchanging the first and second rows yields

$$R_1 \longleftrightarrow R_2 \quad \Rightarrow \quad \begin{bmatrix} -1 & 1 & 2 & 0 \\ 0 & 2 & -1 & 3 \\ 1 & 1 & -3 & 3 \\ 1 & 5 & 5 & 9 \end{bmatrix}$$

\_

Adding the first row to third and fourth rows yields

$$\begin{array}{cccc} R_3 \to R_3 + R_1 \\ R_4 \to R_4 + R_1 \end{array} \Rightarrow \begin{bmatrix} -1 & 1 & 2 & 0 \\ 0 & 2 & -1 & 3 \\ 0 & 2 & -1 & 3 \\ 0 & 6 & 7 & 9 \end{bmatrix}$$

$$\begin{array}{cccc} R_3 \to R_3 - R_2 \\ R_4 \to R_4 - 3R_2 \end{array} \Rightarrow \begin{bmatrix} -1 & 1 & 2 & 0 \\ 0 & 2 & -1 & 3 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 10 & 0 \end{bmatrix}$$

Interchanging the last two rows yields

$$R_3 \longleftrightarrow R_4 \quad \Rightarrow \quad \begin{bmatrix} -1 & 1 & 2 & 0 \\ 0 & 2 & -1 & 3 \\ 0 & 0 & 10 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

This last matrix is in **row-echelon form**.

Multiplying row 1 by -1, row 2 by  $\frac{1}{2}$ , and row 3 by  $\frac{1}{10}$ , yields

$$\begin{array}{cccc} R_1 \to -R_1 \\ R_2 \to \frac{1}{2}R_2 \\ R_3 \to \frac{1}{10}R_3 \end{array} \Rightarrow \begin{bmatrix} 1 & -1 & -2 & 0 \\ 0 & 1 & -\frac{1}{2} & \frac{3}{2} \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Adding 2 times the third row to the first row and  $\frac{1}{2}$  times the third row to the second yields

$$\begin{array}{ccc} R_1 \to R_1 + 2R_3 \\ R_2 \to R_2 + \frac{1}{2}R_3 \end{array} \Rightarrow \begin{bmatrix} 1 & -1 & 0 & 0 \\ 0 & 1 & 0 & \frac{3}{2} \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Replacing the first row with its sum with the second row yields

$$R_1 \to R_1 + R_2 \quad \Rightarrow \quad \begin{bmatrix} 1 & 0 & 0 & \frac{3}{2} \\ 0 & 1 & 0 & \frac{3}{2} \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

This last matrix is in reduced row-echelon form.

(c)

• Replacing the second and third rows, respectively, by their sums with the first row and 2 times the first row yields

$$\begin{array}{cccc} R_2 \rightarrow R_2 + R_1 \\ R_3 \rightarrow R_3 + 2R_1 \end{array} \quad \Rightarrow \quad \left[ \begin{array}{ccccc} -1 & 3 & 0 & 1 & 4 \\ 0 & 0 & 0 & 1 & 3 \\ 0 & 0 & 2 & 6 & 8 \\ 0 & 0 & 1 & 3 & -4 \end{array} \right]$$

Replacing the last row by its sum with  $-\frac{1}{2}$  times the third row yields

$$R_4 \to R_4 - \frac{1}{2}R_3 \quad \Rightarrow \quad \begin{bmatrix} -1 & 3 & 0 & 1 & 4 \\ 0 & 0 & 0 & 1 & 3 \\ 0 & 0 & 2 & 6 & 8 \\ 0 & 0 & 0 & 0 & -8 \end{bmatrix}$$

Interchanging the second and third rows yields

$$R_2 \longleftrightarrow R_3 \quad \Rightarrow \quad \begin{bmatrix} -1 & 3 & 0 & 1 & 4 \\ 0 & 0 & 2 & 6 & 8 \\ 0 & 0 & 0 & 1 & 3 \\ 0 & 0 & 0 & 0 & -8 \end{bmatrix}$$

This last matrix is in **row-echelon form**.

Multiplying the first row by -1, the second row by  $\frac{1}{2}$ , and the fourth row by  $-\frac{1}{8}$  yields

		1	-3	0	-1	-4
$\begin{array}{l} R_1 \to -R_1 \\ R_2 \to \frac{1}{2}R_2 \\ R_4 \to -\frac{1}{8}R_4 \end{array} \Rightarrow$	0	0	1	3	4	
	0	0	0	1	3	
$n_4 \rightarrow -\frac{1}{8}R_4$		0	0	0	0	

Adding, 4 times, -4 times, and -3 times the last row to, respectively, rows 1, 2, and 3 yields

$$\begin{array}{c} R_1 \to R_1 + 4R_4 \\ R_2 \to R_2 - 4R_4 \\ R_3 \to R_3 - 3R_4 \end{array} \Rightarrow \left| \begin{array}{ccccccccccccccc} 1 & -3 & 0 & -1 & 0 \\ 0 & 0 & 1 & 3 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{array} \right|$$

Adding, 1 times and -3 times the third row to, respectively, the first and second rows yields

$$\begin{array}{cccc} R_1 \to R_1 + R_3 \\ R_2 \to R_2 - 3R_3 \end{array} \Rightarrow \left[ \begin{array}{ccccc} 1 & -3 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{array} \right]$$

This last matrix is in reduced row-echelon form.

2. For each linear system below, construct the corresponding augmented matrix

(a)

(b)

3. Describe all the solutions of a linear system whose corresponding augmented matrix can be row reduced to the given matrix.

(a)

$$\left[\begin{array}{ccc|c} 1 & 0 & 2 & 0 & | & 1 \\ 0 & 1 & 1 & 3 & | & -2 \\ 0 & 0 & 0 & 0 & | & 0 \end{array}\right]$$

- Note that there are two pivots and four columns in the first block. According to the theorem at the end of Lecture 5 (Theorem 1.7 in the text) this meas that the number of free variables will be 4-2. To see this more explicitly, let's write down the corresponding linear system
- (1)

$$\begin{array}{rcrcrcr} x_1 + 2x_3 & = & 1 \\ x_2 + x_3 + 3x_4 & = & -2 \\ 0 & = & 0 \end{array}$$

The last equation is of no consequence. However, the first two equations can be used, respectively, to express  $x_1$  and  $x_2$  in terms of  $x_3$  and  $x_4$ :

(2) 
$$x_1 = 1 - 2x_3$$
  
 $x_2 = -2 - x_3 - 3x_4$ 

But there is nothing left to determine  $x_3$  and  $x_4$ . Thus we have two free variables: so long as we use equations (2) to determine  $x_1$  and  $x_2$ , we can use any values we want for  $x_3$  and  $x_4$  and we'll still satisfy (1).

Let's now write down the form of a typical solution vector

$$\mathbf{x} = \begin{bmatrix} 1 - 2x_3 \\ -2 - x_3 - 3x_4 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 1 \\ -2 \\ 0 \\ 0 \end{bmatrix} + x_3 \begin{bmatrix} -2 \\ -1 \\ 1 \\ 0 \end{bmatrix} + x_4 \begin{bmatrix} 0 \\ -3 \\ 0 \\ 1 \end{bmatrix}$$

This exhibits our solutions as forming a 2-dimensional hyperplane in  $\mathbb{R}^4$ .

(b)

$$\left[\begin{array}{cccc|c} 1 & -1 & 2 & 0 & 3 & | & 1 \\ 0 & 0 & 0 & 1 & 4 & | & 2 \\ 0 & 0 & 0 & 0 & 0 & | & -1 \\ 0 & 0 & 0 & 0 & 0 & | & 0 \end{array}\right]$$

• This augmented matrix is equivalent to the following system of linear equations

$$x_1 - x_2 + 2x_3 + 3x_5 = 1$$
  

$$x_4 + 4x_5 = 2$$
  

$$0 = -1$$
  

$$0 = 0$$

The fourth equation is obviously a contradiction. Hence, there is no solution to the linear system corresponding to this augmented matrix. This situation is of course predicted by Part 1 of the theorem at the end of Lecture 5 (Theorem 1.7 in the text).  $\Box$ 

4. Find all solutions of the given linear system.

(a)

$$\begin{array}{rcl} 2x - y &=& 8\\ 6x - 5y &=& 32 \end{array}$$

• The corresponding augmented matrix is

$$\left[\begin{array}{cc|c} 2 & -1 & 8 \\ 6 & -5 & 32 \end{array}\right]$$

Replacing the second row with its sum with -3 times the first yields

$$R_2 \to R_2 - 3R_1 \quad \Rightarrow \quad \left[ \begin{array}{ccc} 2 & -1 & | & 8 \\ 0 & -2 & | & 8 \end{array} \right]$$

Above is the augemented matrix in row echelon form. Let's continue to row reduce to reduced-rowechelon-form.

$$\begin{array}{cccc}
R_1 \to \frac{1}{2}R_1 \\
R_2 \to -\frac{1}{2}R_2 \\
\end{array} \Rightarrow \begin{bmatrix}
1 & -\frac{1}{2} & 4 \\
0 & 1 & -4
\end{bmatrix}$$

$$\begin{array}{cccc}
R_1 \to R_1 + \frac{1}{2}R_2 \\
\end{array} \Rightarrow \begin{bmatrix}
1 & 0 & 2 \\
0 & 1 & -4
\end{bmatrix}$$

This augmented matrix is in reduced-row-echelon-form; it will be the augmented matrix of our solution equations. Converting back to equations we get

$$\begin{array}{rcl} x & = & 2 \\ y & = & -4 \end{array}$$

(b)

$$y + z = 6$$
  

$$3x - y + z = -7$$
  

$$x + y - 3z = -13$$

• The corresponding augmented matrix is

$$\begin{bmatrix} 0 & 1 & 1 & | & 6 \\ 3 & -1 & 1 & | & -7 \\ 1 & 1 & -3 & | & -13 \end{bmatrix}$$

Let's row reduce this augmented matrix to reduced-row-echelon-form.

$$R_{1} \longleftrightarrow R_{2} \Rightarrow \begin{bmatrix} 3 & -1 & 1 & | & -7 \\ 0 & 1 & 1 & | & 6 \\ 1 & 1 & -3 & | & -13 \end{bmatrix}$$

$$R_{3} \to R_{3} - \frac{1}{3}R_{1} \Rightarrow \begin{bmatrix} 3 & -1 & 1 & | & -7 \\ 0 & 1 & 1 & | & 6 \\ 0 & \frac{4}{3} & -\frac{10}{3} & | & -\frac{32}{3} \end{bmatrix}$$

$$R_{3} \to R_{3} - \frac{4}{3}R_{2} \Rightarrow \begin{bmatrix} 3 & -1 & 1 & | & -7 \\ 0 & 1 & 1 & | & 6 \\ 0 & 0 & -\frac{14}{3} & | & -\frac{56}{3} \end{bmatrix}$$

This augmented matrix is in row-echelon form.

$$\begin{array}{cccc} R_1 \to \frac{1}{3}R_1 \\ R_3 \to -\frac{3}{14}R_3 \\ R_2 \to R_2 - R_3 \end{array} \Rightarrow \begin{bmatrix} 1 & -\frac{1}{3} & \frac{1}{3} & | & -\frac{7}{3} \\ 0 & 1 & 1 & | & 6 \\ 0 & 0 & 1 & | & 4 \end{bmatrix}$$
$$\begin{array}{c} R_1 \to R_1 - \frac{1}{3}R_3 \\ R_2 \to R_2 - R_3 \\ R_1 \to R_1 + \frac{1}{3}R_2 \\ R_1 \to R_1 + \frac{1}{3}R_2 \end{array} \Rightarrow \begin{bmatrix} 1 & -\frac{1}{3} & 0 & | & -\frac{11}{3} \\ 0 & 1 & 0 & | & 2 \\ 0 & 0 & 1 & | & 4 \end{bmatrix}$$

We've now arrived at the augmented matrix in reduced-row-echelon-form. The corresponding equations (of the solution) are

5. Determine whether the vector

$$\mathbf{b} = \begin{bmatrix} 3\\5\\3 \end{bmatrix}$$

is in the span of the vectors

$$\mathbf{v}_1 = \begin{bmatrix} 0\\2\\4 \end{bmatrix} \quad , \quad \mathbf{v}_2 = \begin{bmatrix} 1\\4\\-2 \end{bmatrix} \quad , \quad \mathbf{v}_3 = \begin{bmatrix} -3\\-1\\5 \end{bmatrix}$$

• By definition, if **b** lies in the span of  $\mathbf{v}_1$ ,  $\mathbf{v}_2$ , and  $\mathbf{v}_3$ , then

(3)

$$\mathbf{b} = x_1 \mathbf{v}_1 + x_2 \mathbf{v}_2 + x_3 \mathbf{v}_3$$

for some choice of coefficients  $x_1$ ,  $x_2$  and  $x_3$ . In terms of components, this vector equation is

$$\begin{bmatrix} 3\\5\\3 \end{bmatrix} = x_1 \begin{bmatrix} 0\\2\\4 \end{bmatrix} + x_2 \begin{bmatrix} 1\\4\\-2 \end{bmatrix} + x_3 \begin{bmatrix} -3\\-1\\5 \end{bmatrix} = \begin{bmatrix} x_2 - 3x_3\\2x_1 + 4x_2 - x_3\\4x_1 - 2x_2 + 5x_3 \end{bmatrix}$$

or

$$\begin{array}{rcrcrcrcr} x_2 - 3x_3 &=& 3\\ 2x_1 + 4x_2 - x_3 &=& 5\\ 4x_1 - 2x_2 + 5x_3 &=& 3 \end{array}$$

The augmented matrix for this linear system is

$$\begin{bmatrix} 0 & 1 & -3 & | & 3 \\ 2 & 4 & -1 & | & 5 \\ 4 & -2 & 5 & | & 3 \end{bmatrix}$$

Interchanging the first and second rows yields

$$R_1 \longleftrightarrow R_1 \quad \Rightarrow \quad \begin{bmatrix} 2 & 4 & -1 & | & 5 \\ 0 & 1 & -3 & | & 3 \\ 4 & -2 & 5 & | & 3 \end{bmatrix}$$

Replacing the third row with its sum with -2 times the first row yields

$$R_3 \to R_3 - 2R_1 \quad \Rightarrow \quad \begin{bmatrix} 2 & 4 & -1 & 5 \\ 0 & 1 & -3 & 3 \\ 0 & -10 & 7 & -7 \end{bmatrix}$$

Replacing the third row with its sum with 10 times the second row yields

$$R_3 \to R_3 + 10R_2 \quad \Rightarrow \quad \begin{bmatrix} 2 & 4 & -1 & 5 \\ 0 & 1 & -3 & 3 \\ 0 & 0 & 23 & -23 \end{bmatrix}$$

According the theorem at the end of Lecture 5, the linear system corresponding to such an augmented matrix does indeed have a solution (in fact, a unique solution).

Гаи

We conclude that we can find values of  $x_1$ ,  $x_2$ , and  $x_3$  such that (3) holds. Hence, **b** is in the span of  $\mathbf{v}_1$ ,  $\mathbf{v}_2$ , and  $\mathbf{v}_3$ .
